Primeprint Solution

Primeprint Solution is designed and built for dental excellence in practice and labs by one of the leading provider in digital dentistry. This 3D printing solution enables users to improve their patient's experience by offering additional procedures, such as splints, that can grow their practice and/or lab. Primeprint Solution is powered by DS Core, integrating seamlessly into existing digital workflows and with other solutions within the DS digital universe for excellent performance and growth opportunities in both dental practices and labs.

Primeprint Solution – A medical-grade 3D printing solution

Primeprint Solution is a simplified and highly automated end-to-end 3D printing solution, from dental intelligent software to 3D printing and fully automated post-processing. Regulated parameters help to ensure repeatable high quality of printed appliances for excellent treatment outcomes. Primeprint Solution offers convenient and easy 3D printing and post-processing for the production of biocompatible applications.

Material concept

3D printing with Primeprint Solution is based on restoration data from various possible design options: Design with CEREC Software, inLab CAD Software, or DS Core Create – for a fully validated CAD/CAM workflow.

Designed and built for dental excellence

Primeprint Solution has been developed as a medical-grade 3D printing solution to enhance patient care. Dental intelligent software and hardware together enable you to print biocompatible applications with repeatable and accurate results.[1]

Primeprint Solution allows for full delegation and helps you maximize your productivity thanks to its high level of automation and reduced handling times.

Primeprint's quality process protocol, involving automated processing times, supports a high level of safety based on medical device compliance and automatic case documentation. The innovative Primeprint Box enables convenient and easy material handling without direct contact with resins.

Dentsply Sirona developed Primeprint Solution according to the requirements outlined in the FDA`s guidance "Technological considerations for additive manufactured medical devices". Furthermore, Primeprint Solution complies with MDR material manufacturer process specifications.
Applications with Primeprint Solution
| Splint | Thermoforming Model | Impression Tray | Temporary | Surgical Guide | Working Model | Solid Model | Cast |

Primeprint Solution – CAM Software

The inLab CAM Software was specifically developed for use with Dentsply Sirona manufacturing units. With a few automated steps, you prepare the fully constructed application in the CAM software. The software controls all necessary print and post-processing steps in a fully automated way and monitors the complete process up to the building platform removal from the PPU.

Flexible integration and seamless workflows

3D printing with Primeprint Solution is based on restoration data from various possible design options.

Primeprint PPU – Post-Processing Unit

The PPU performs all post-processing steps required for the dental 3D print automatically and without manual interaction – with the option to delegate.

- Pre-washing: First wash cycle

- Final washing: Second wash cycle

- Drying

- Light-curing

Thus, any time-consuming manual post-processing is eliminated. All PPU process steps are protected from UV light and are controlled and monitored by the CAM software. A protocol can be created as PDF.

Click on a image

Primeprint Solution – Material concept

Validated materials and RFID-supported, automated material management support quality, process, and documentation security. All material parameters were optimized to offer a high level of process safety for each application.

The Primeprint material concept offers user-friendly support with its color-coded material cartridge system. Each print material type is associated with a different color, which is mirrored in the CAM software for quick orientation, for correct material selection, and easily identifiable storage.

3D printing has just taken the next leap forward with Primeprint. With the combination of complete integration, enclosed automated workflow, and industry defining efficiency, Primeprint gives me and, most importantly, my staff confidence that we are delivering very good and safe 3D printed parts to our patients. Furthermore, the automation supports that every application we 3D print is processed, cleaned and cured to a very high standard.

DS Core
and DS Core Create

DS Core is the gateway to the digital universe of Dentsply Sirona solutions, built to empower your growth by offering a more integrated practice. DS Core provides a cloud storage and patient files sharing solution that supports GDPR/HIPAA compliant collaboration with colleagues and partners.[1,2]

With DS Core Create dentists get access to high-quality custom designs created by expert lab technicians. The designs can easily be requested via DS Core without having to operate a design software.[1,3]

I am more than enthusiastic about Primeprint Solution, as it means 3D printing on a completely new level for our dental lab. The intelligent CAM software already places the print objects appropriately on the building platform with the "Fast Forward" function. I can quickly and easily switch between the different materials and work with a high level of efficiency. The handling with the color-coded material units and washing containers makes the entire process clean and efficient, and thanks to the activated carbon filter I can also work easily with Isopropanol. The printer speed allows me to run multiple print jobs, even during the day. Previously, I was used to print overnight and was then stuck with a material – this has changed now.

Dental Intelligence from CAD to CAM

- Object data designed with CEREC or inLab CAD Software are seamlessly transmitted to the inLab CAM Software, without the need for further manual steps
- The CAM software automatically suggests the Primeprint validated print material for each print object
- The CAM software automatically incorporates the requirements regarding alignment, support, and post-processing for each print object

In addition to purely geometrical generated design data, CEREC and inLab CAD Software contain additional specific dental information regarding application aspects, such as functional areas and important geometries, which require special consideration during the 3D printing process. For 3D prints with Primeprint Solution, the CAM software algorithm detects and applies this specific dental information to optimize the print job.

For 3D prints with Primeprint Solution, the CAM software algorithm detects and applies this specific dental information to optimize the print job.

<
A surgical guide has two particularly sensitive aspects: The guide sleeve must fit exactly into the hole, and there must be an exact fit in areas with remaining dentition. The CAM software automatically takes these requirements into consideration for 3D prints with Primeprint Solution.

Preparation of object and fabrication structures

Support structures as well as drainage canals and vents are automatically placed by the software but can also be added, removed, and repositioned manually.

Customized adjustments of functional areas during the preparation of STL design data are especially important in order to create an optimal 3D print. For example:

- Targeted addition or removal of drainage canals and vents.
- Marking areas that may not be used for support structures.
- Hollowing solid models.

Analysis tools

For quality enhancement, the software indicates compliance or noncompliance with manufacturer-specified wall strength – a special advantage of the validation process that was performed for each Primeprint material. As such, additional corrections can be made, for example in the case file when cases of noncompliance are detected.

A color-coded system interactively visualizes the support quality.

The software indicates where air may potentially get trapped during the wash process later on or where puddling of resin may occur, which might not be cleaned up. In this case, drainage canals can be positioned virtually, based on the planned print placement, directly in the CAM software without the need to go back to the design phase.

Depending on the application and its desired surface quality, different thicknesses can be defined with the appropriate detail level, thereby optimizing print times.

Dr. Meena Barsoum (sponsored), Dentist, Impressive Smiles, Arlington Heights, IL, USA

Primeprint Solution has been a very important part of our practice. We deliver a large number of splints and occlusal guards each month, so being able to manufacture them in-house created a solution with a high level of cost-efficiency for our patients. I can trust the post-processing unit to deliver clean and safe medical devices for my patients, without any risk of cross-contamination with other types of resins.

Depending on the type and number of objects intended for a print process, the Primeprint system dispenses the appropriate amount of print resin from the cartridge into the print vat and monitors its use. The software detects the fill level automatically and notifies the user when the material cartridge must be replaced.

Primeprint – 3D Printer

Before starting the manufacturing step, the Primeprint Material Unit and Primeprint Box together with the building platform are inserted into the 3D printer, then the print process can begin immediately. After completing the print, the 3D printer can immediately be prepared for the next print job. Simply change Primeprint Box and material unit.

The Primeprint Box offers a high degree of cleanliness and safety throughout the print and post-processing steps, thus avoiding user and workspace contamination. The box holds the building platform and transports it with a high level of safety and protected from UV light throughout the complete manufacturing process.

The objects are printed on the building platform, which is securely transported inside the Primeprint Box. The building platform is fitted with an RFID tag, which ensures safe identification of the print job.

Primeprint PPU – Post-Processing Unit

The PPU performs all post-processing steps required for the dental 3D print automatically and without manual interaction – with the option to delegate.

- Pre-washing: First wash cycle
- Final washing: Second wash cycle
- Drying
- Light-curing

Thus, any time-consuming manual post-processing is eliminated. All PPU process steps are protected from UV light and are controlled and monitored by the CAM software. A protocol can be created as PDF.

The process can be started directly via the Primeprint PPU 7" touch screen, and various information can be obtained, e.g.:
- Job availability and status
- Washing container availability and status
- System setting
- Start job

and more.

X

After the print is completed, only the Primeprint Box is removed from the printer and placed into the PPU. The Primeprint Box is sealed and protected from UV light; it does not require any additional contact precautions. Based on the RFID identifier, the individual job is detected and the fully automated post-processing begins with just one click on the screen. The rest is taken care of by the PPU.

All processes are individually developed for each material and are validated by the respective material manufacturer.

Consecutive pre- and final washing cycles use cleaning agent in the two integrated washing containers to remove liquid print resin residues from the printed objects. The Primeprint Washing Container concept allows each container to be filled with up to 2.5 l of isopropanol, thus enabling the individual storage of several containers.

The washing containers can easily be removed and reinserted and feature automatic fill level monitoring and leak protection. The assignment to pre- and final wash is done automatically. The software tracks the wash cycles of each container via their RFID tags, monitors the corresponding cleaning agent lifetime per washing container, and automatically alerts the user when cleaning agent must be exchanged.

After the cleaning processes, the PPU dries the printed objects, quickly removing cleaning agent residues without interruption. Isopropanol fumes generated during this process are removed with the integrated activated carbon filter and fan within the PPU. No fumes are released into the environment, so no external ventilation is required.

The light-curing process is automatically initiated inside the integrated light-curing chamber of the PPU – a highly productive post-curing in a protective gas atmosphere and with active nitrogen management.

The completed printed objects are attached to the building platform with the support structures and can be removed quickly and easily with just a few moves.

The Primeprint Solution Platform Holder is specially designed to make removal even easier. It anchors the building platform in a non-slip manner and catches detached print parts.
Primeprint Solution – Material concept

Validated materials and RFID-supported, automated material management support quality, process, and documentation security. All material parameters were optimized to offer a high level of process safety for each application.

The Primeprint material concept offers user-friendly support with its color-coded material cartridge system. Each print material type is associated with a different color, which is mirrored in the CAM software for quick orientation, for correct material selection, and easily identifiable storage.

As a newcomer in dental 3D printing, I am not only interested in a broad range of indications, but also in easy handling and smooth integration into our practice processes. And this has been achieved particularly well with Primeprint Solution. In my opinion, the software is very user-friendly and can be integrated very well into my digital workflow. The printer and post-processing unit offer a high level of user-friendliness and clean 3D printing thanks to no contact with printing resins. All this means enormous time savings and safety for us in our day-to-day practice. And I can delegate the 3D printing tasks to my practice team with a good feeling.

# Primeprint Solution –

The Primeprint Solution workflow in the practice:

1 Intraoral scanning

Primescan enables high precision digital impressions with a patented scanning technology. Impression taking with Primescan is easy and intuitive. Because Primescan offers freedom of choice in the design of workflows, dentists can arrange their workflows according to their preferences.

2 Application design

The design can either be created with the CEREC Software or the dentist uses DS Core Create to get access to high-quality custom designs created by expert lab technicians. The designs can easily be requested via DS Core without having to operate a design software.

3 Preparation of print job

After automatic job preparation in the CAM software, the 3D printing process can begin immediately.

4 3D printing and post-processing

Primeprint Solution reduces handling times and manual work, allows for full delegation, and maximizes productivity. The use of regulated parameters help to ensure high quality of printed appliances for excellent treatment outcomes. The Primeprint Box enables convenient and easy material handling without direct contact with resins.

Primeprint printer and Primeprint PPU are two closed desktop units, which easily integrate into the dental practice. A particular advantage is that no fume hood is required.

5 Finalization

The platform holder offers convenient support for the fast removal of printed objects from the building platform, before the support structures are removed and the applications can be prepared for further employment.

Primeprint Solution –
In the dental lab

Primeprint Solution expands the digital manufacturing options in the dental lab and can be integrated easily into existing digital workflow.

Learn more   >

Click on the arrow
to learn more

The Primeprint Solution workflow in the dental lab:

1 Digital design

In the dental laboratory, the restoration design is created based on intraoral or extraoral scan data and carried out using the dental laboratory's CAD software, e.g. inLab Software, or software from another manufacturer[1]. inLab CAD Software automatically takes into account the design parameters for 3D printing with Primeprint.

2 Preparation of print job

Object and order data from the inLab CAD software are automatically applied from the inLab CAM Software, which eliminates the need to enter them again. Design data of other CAD software are imported into the open inLab CAM Software in STL format[1] and prepared for the print process with just a few clicks.

3 3D printing and post-processing

3D printing and post-processing with Primeprint Solution are easily and comfortably performed in the dental lab through a highly automated process.

4 Finalization

The Primeprint Solution Platform Holder supports quick removal of the printed objects from the building platform before support structures can be removed, and the application can be prepared for further processing.
