

# Newly Launched Aquasil Ultra+ Smart Wetting Impression Material Receives Highest Ratings among Two Large Rating Agencies

In keeping with a long tradition of offering meaningful innovation to the market, Dentsply Sirona recently introduced **Aquasil® Ultra+ Smart Wetting® Impression Material**. A completely redesigned VPS offering, Aquasil Ultra+ material merges state-of-the-art intraoral hydrophilicity and intraoral tear strength to deliver better-than-ever results--optimizing performance in all areas, not just one. The plus means clinicians do not have to choose between wettability, tear strength, speed, and delivery options.

Today, Dentsply Sirona is proud to announce Aquasil Ultra+ material has received top honors among two rating agencies—the “5 Star” *Reality Now* rating and “Best Product” rating from *Dental Product Shopper*\*. Both evaluations spoke to the high performance of the product's hydrophilicity, tear strength, and flow. *Reality Now* evaluators (an international evaluator panel) rated Aquasil Ultra+ material as the standard of excellence for impression materials. Likewise, *Dental Product Shopper* found Aquasil Ultra+ material to be a superior product over what they are using today, adding predictability and performance to their final impression taking procedures.

Aquasil Ultra+ material is a final VPS impression material indicated for use in all dental impression techniques.

### A No-Compromise VPS Solution

Aquasil Ultra+ material provides clinicians a no-compromise solution to their final impression needs with market leading intraoral hydrophilicity and intraoral tear strength. Historically, the market has measured impression material performance outside of the clinical context in which a dentist works. Leveraging the latest technology, Dentsply Sirona tests and publishes clinically relevant intraoral performance to better **empower clinicians** to make clinical decisions.

Aquasil Ultra+ material's **market leading intraoral hydrophilicity** is designed to help clinicians avoid trapping fluid from the moment the material is syringed into the oral cavity, helping clinicians alleviate voids and bubbles at or near the margin.

**Market leading intraoral tear strength** delivers a material designed to help clinicians reduce risks of tears at the margin while the material is in thin cross-sections and when being removed from the patient's mouth, including in cases where retraction paste is used.
