Remove the cap by turning it 90° counter-clockwise and pulling it.

To ensure an appropriate mixing ratio, dispense a small amount of paste from the syringe prior to the first clinical application.

Attach the mixing tip to the syringe, aligning the notch. Then turn the tip 90° clock-wise.

The intraoral tip can be rotated and the angle adjusted.
For intraoral use, it is recommended to cover Ribbon® Mixing Syringe with the Disposa-Shield® Sleeve*.

The sealer can be applied directly to the root canal orifices or extruded conventionally on a mixing pad.

After the sealer application, mixing tip and intraoral tip must be discarded. Replace the cap on the syringe head.

* Disposa-Shield® Sleeves (A88013) are available on our website.
