Dentsply Sirona

3D printing solution for practice and lab

# Primeprint Solution<sup>TM</sup>

Learn more

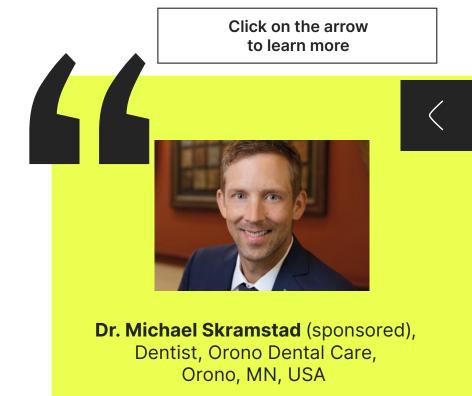

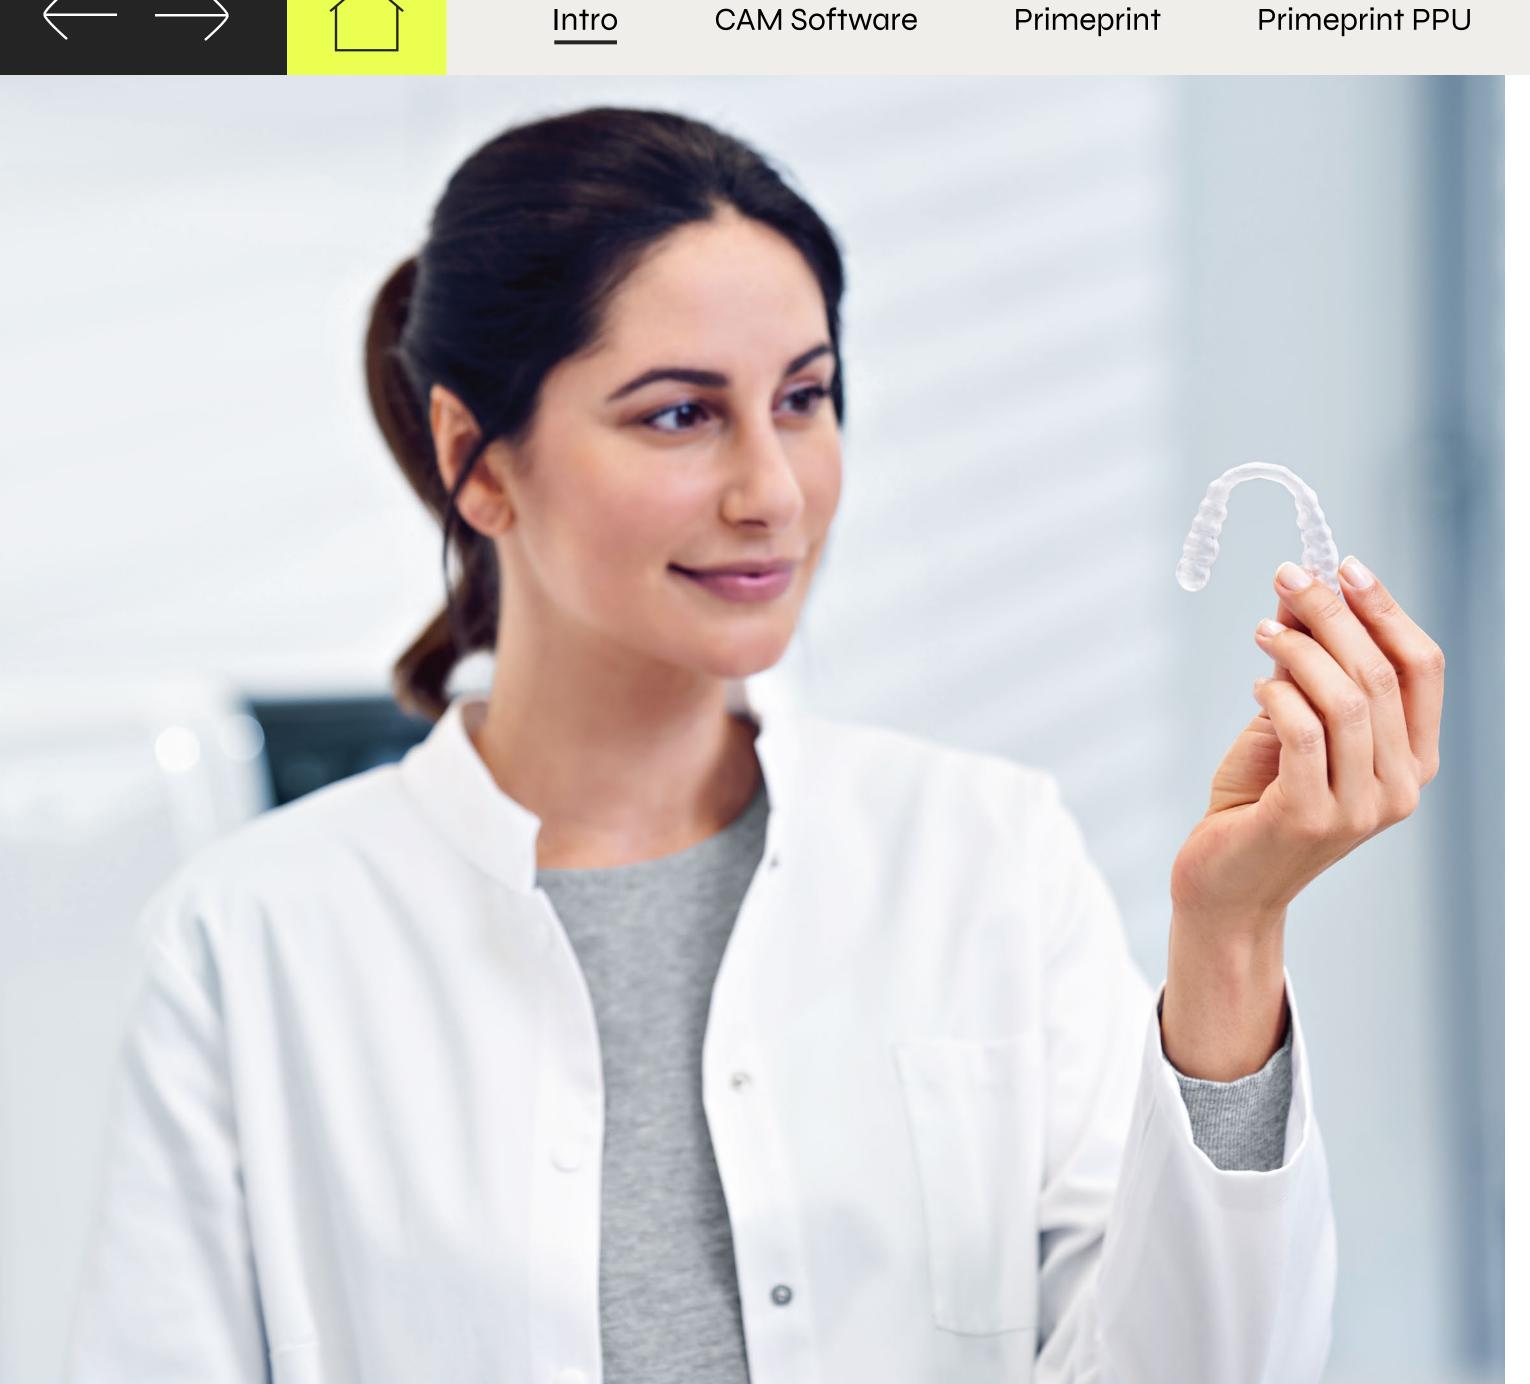

Primeprint Solution is designed and built for dental excellence in practice and labs by one of the leading provider in digital dentistry. This 3D printing solution enables users to improve their patient's experience by offering additional procedures, such as splints, that can grow their practice and/or lab. Primeprint Solution is powered by DS Core, integrating seamlessly into existing digital workflows and with other solutions within the DS digital universe for excellent performance and growth opportunities in both dental practices and labs.

# Designed and built for dental excellence

Material concept

Primeprint Solution has been developed as a medical-grade 3D printing solution to enhance patient care. Dental intelligent software and hardware together enable you to print biocompatible applications with repeatable and accurate results.<sup>1</sup>

Workflow

Primeprint Solution allows for full delegation and helps you maximize your productivity thanks to its high level of automation and reduced handling times.

Primeprint's quality process protocol, involving automated processing times, supports a high level of safety based on medical device compliance and automatic case documentation. The innovative Primeprint Box enables convenient and easy material handling without direct contact with resins.

Dentsply Sirona developed Primeprint Solution according to the requirements outlined in the FDA's guidance "Technological considerations for additive manufactured medical devices". Furthermore, Primeprint Solution complies with MDR material manufacturer process specifications.

3D printing has just taken the next leap forward with Primeprint. With the combination of complete integration, enclosed automated workflow, and industry defining efficiency, Primeprint gives me and, most importantly, my staff confidence that we are delivering very good and safe 3D printed parts to our patients. Furthermore, the automation supports that every application we 3D print is processed, cleaned and cured to a very high standard.

**Christian Schuchmann** (sponsored) Dental Technician and Managing Director Dental-Labor Teuber, Darmstadt, Germany

I am more than enthusiastic about Primeprint Solution, as it means 3D printing on a completely new level for our dental lab. The intelligent CAM software already places the print objects appropriately on the building platform with the "Fast Forward" function. I can quickly and easily switch between the different materials and work with a high level of efficiency. The handling with the color-coded material units and washing containers makes the entire process clean and efficient, and thanks to the activated carbon filter I can also work easily with Isopropanol. The printer speed allows me to run multiple print jobs, even during the day. Previously, I was used to print overnight and was then stuck with a material – this has changed now.

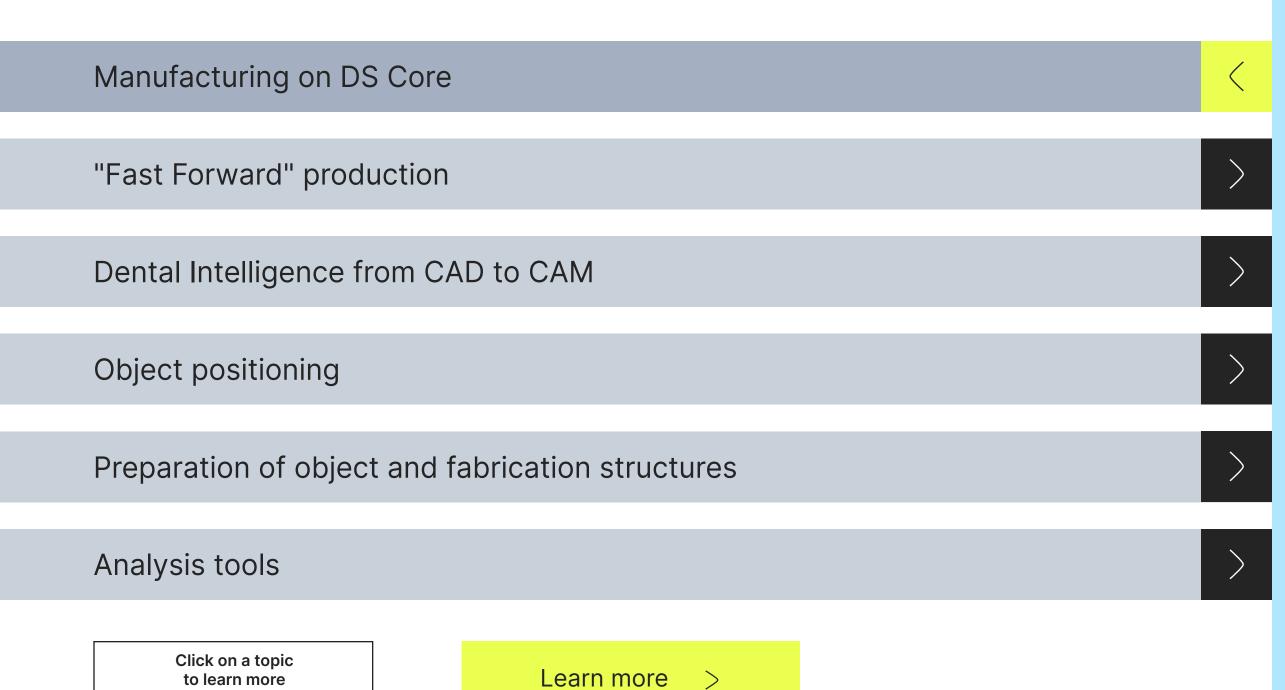

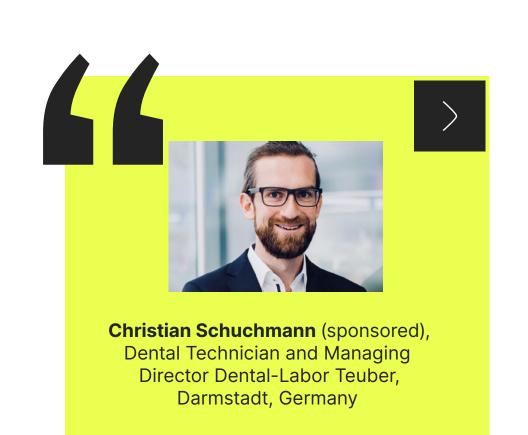

**CAM Software** 

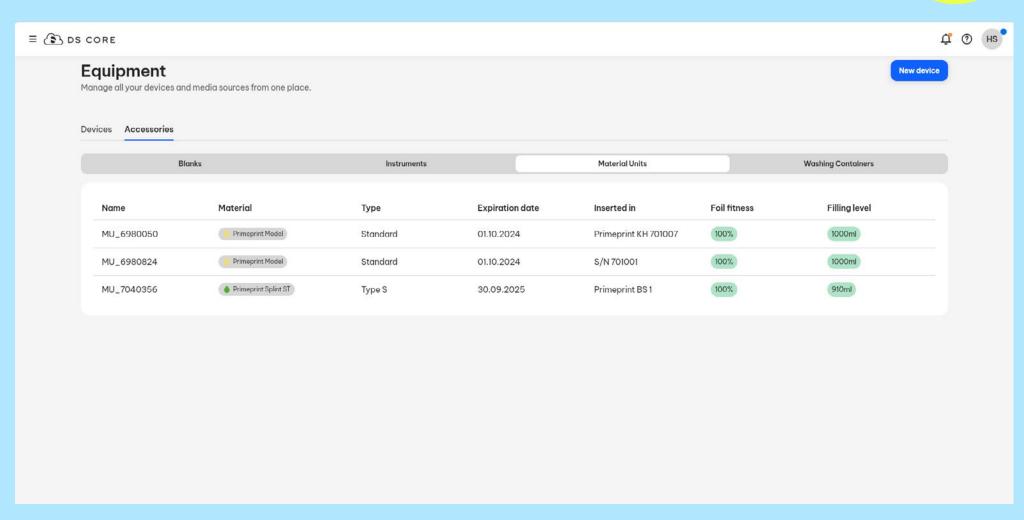

### CAM software functions

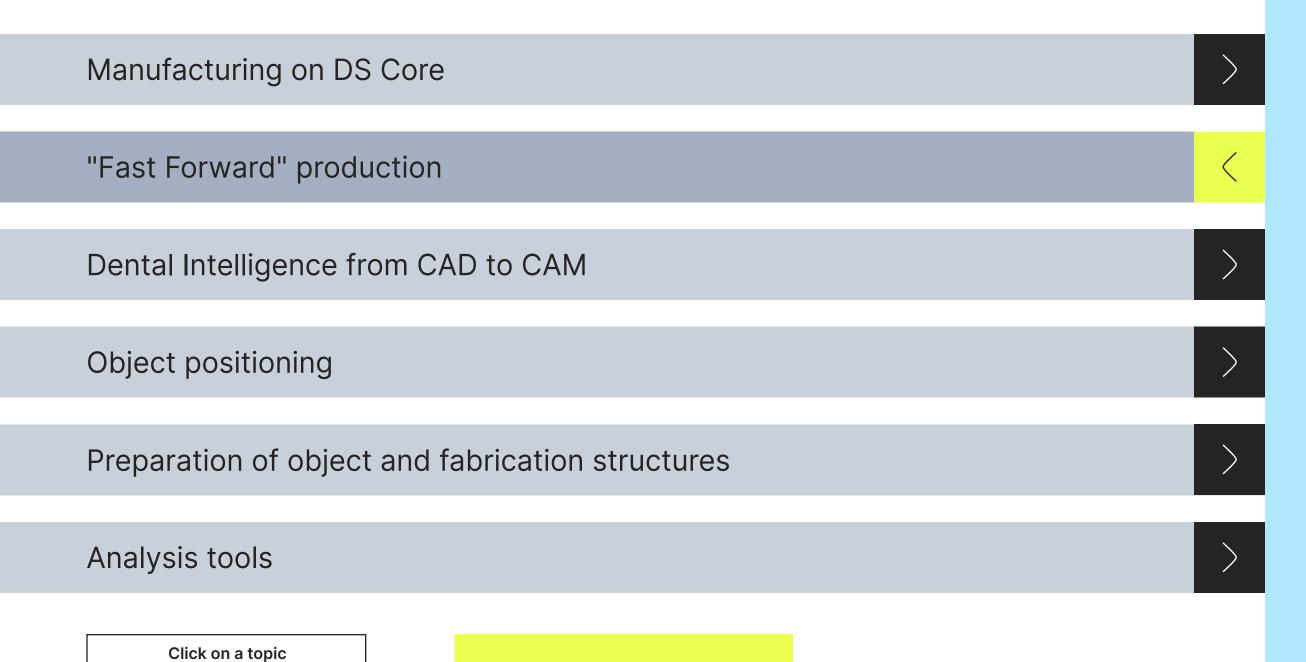

#### Manufacturing on DS Core

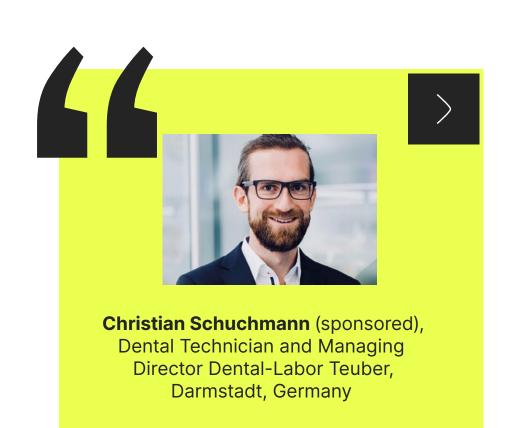

Manufacturing on DS Core is a feature set that is accessible via DS Core and enables to benefit from various inLab CAM functions in the cloud environment.<sup>1</sup> Milling or printing jobs can be started on any connected equipment, regardless of location, directly from DS Core. Centralized management of all manufacturing tasks and equipment is possible in one place, ensuring optimal utilization and real-time oversight. After the manufacturing an automated manufacturing report can be downloaded, directly saved to DS Core. Real-time status updates on accessories and consumables, support efficient operation and enhanced maintenance.

1 A standard or advanced DS Core subscription is mandatory for accessing this feature set.

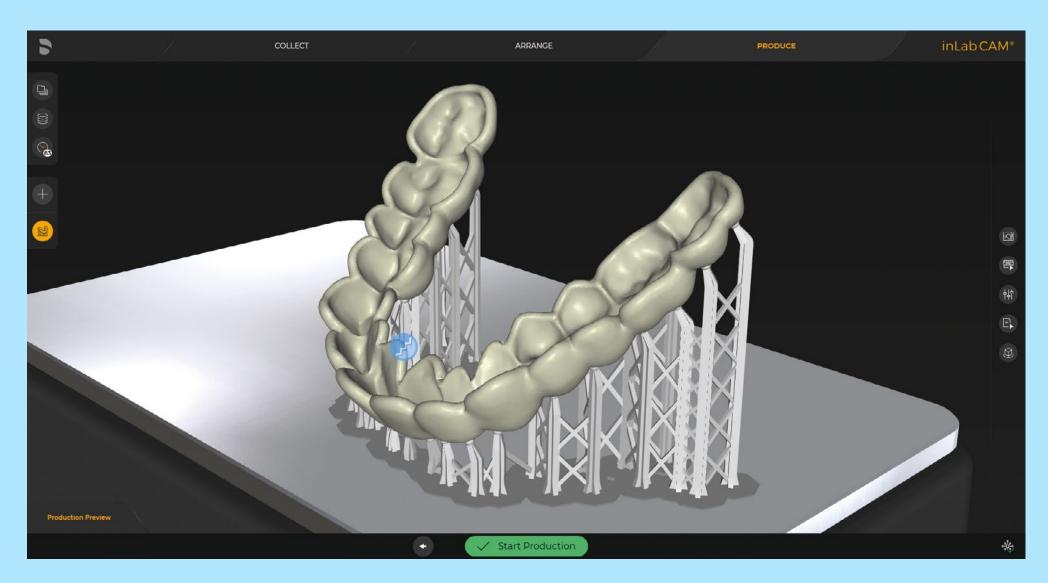

Learn more >

to learn more

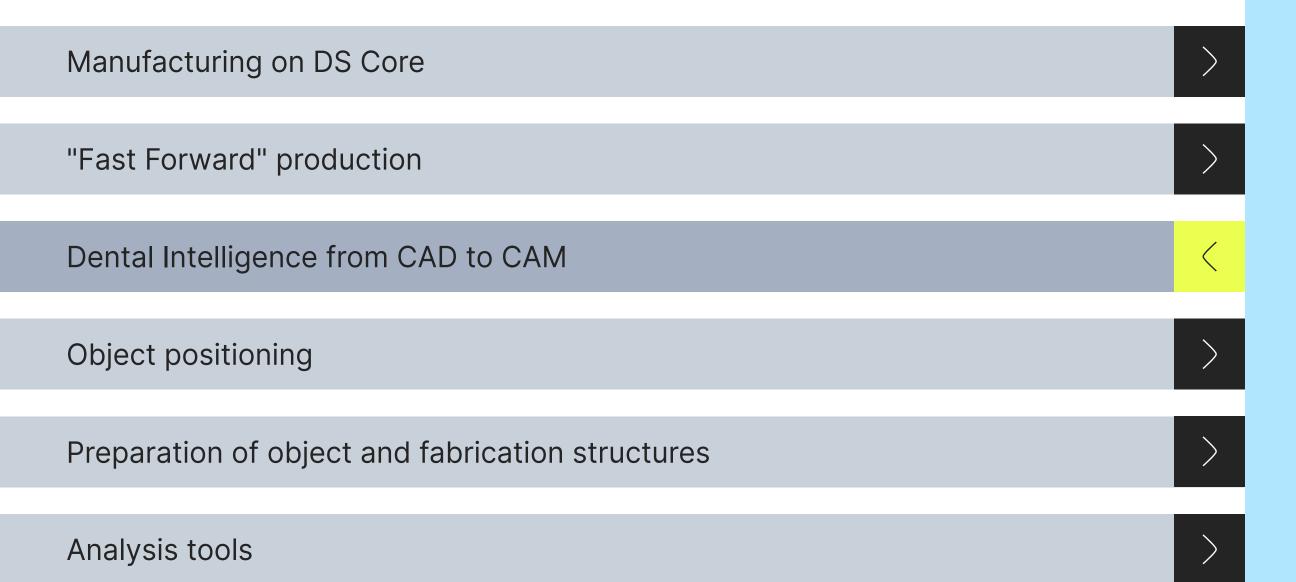

#### "Fast Forward" production

The printing process can be initiated immediately, in a time saving manner and without the need for further manual adjustments. Alternatively, the CAM software guides the user step-by-step through the particular print object preparation, offering different adjustment options as desired.

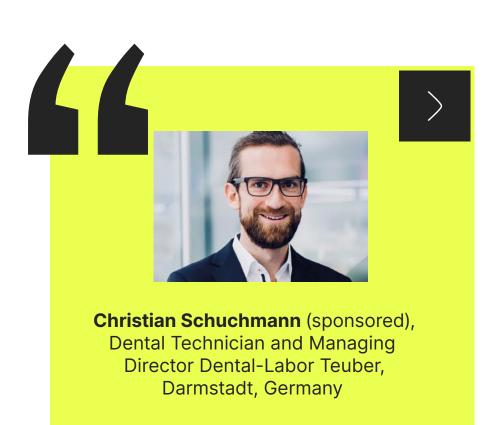

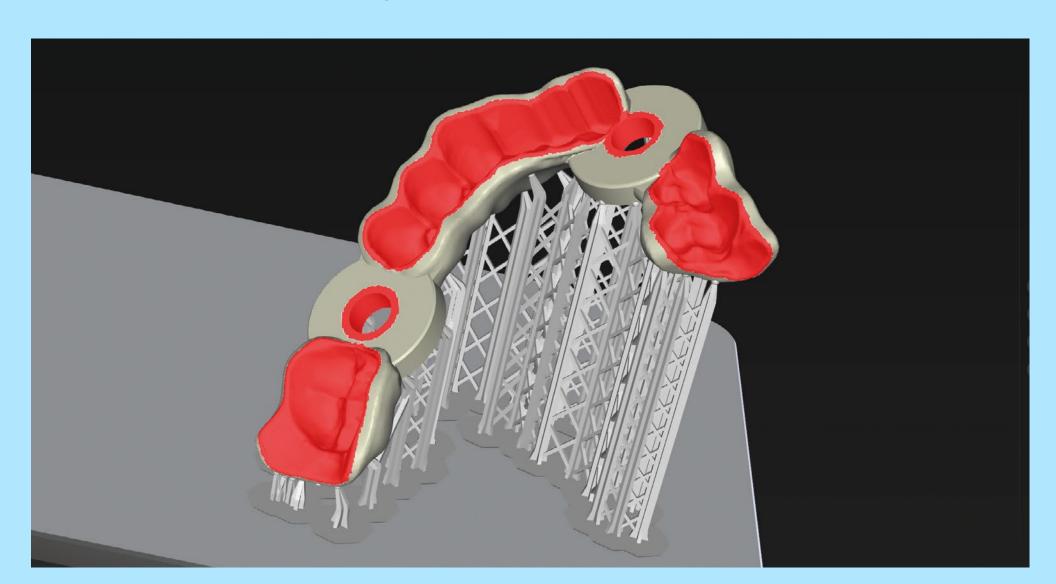

Click on a topic to learn more

Learn more >

#### Dental Intelligence from CAD to CAM

- Object data designed with CEREC or inLab CAD Software are seamlessly transmitted to the inLab CAM Software, without the need for further manual steps
- The CAM software automatically suggests the Primeprint validated print material for each print object
- The CAM software automatically incorporates the requirements regarding alignment, support, and post-processing for each print object

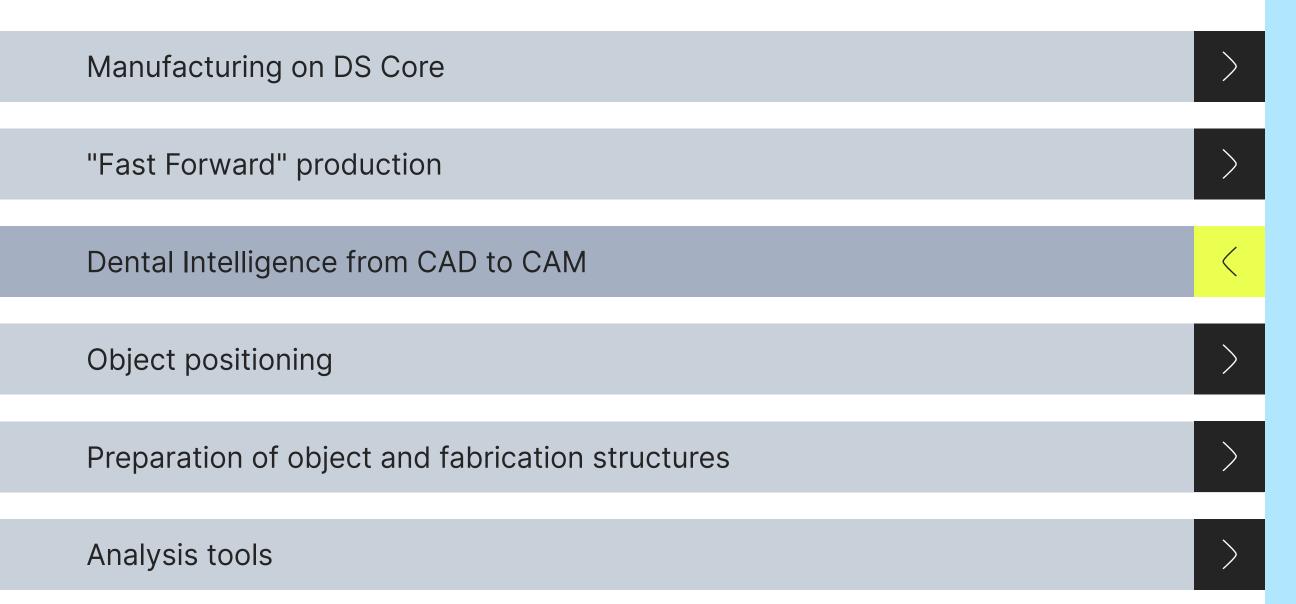

In addition to purely geometrical generated design data, CEREC and inLab CAD Software contain additional specific dental information regarding application aspects, such as functional areas and important geometries, which require special consideration during the 3D printing process. For 3D prints with Primeprint Solution, the CAM software algorithm detects and applies this specific dental information to optimize the print job.

An example

- The CAM software automatically incorporates the requirements regarding alignment, support, and post-processing for each print object

In addition to purely geometrical generated design data, CEREC and inLab CAD Software contain additional specific dental information regarding application aspects, such as functional areas and important geometries, which require special consideration during the 3D printing process. For 3D prints with Primeprint Solution, the CAM software algorithm detects and applies this specific dental information to optimize the print job.

A surgical guide has two particularly sensitive aspects: The guide sleeve must fit exactly into the hole, and there must be an exact fit in areas with remaining dentition. The CAM software automatically takes these requirements into consideration for 3D prints with Primeprint Solution.

#### Preparation of object and fabrication structures

Support structures as well as drainage canals and vents are automatically placed by the software but can also be added, removed, and repositioned manually.

Customized adjustments of functional areas during the preparation of STL design data are especially important in order to create an optimal 3D print. For example:

- Targeted addition or removal of drainage canals and vents.
- Marking areas that may not be used for support structures.
- Hollowing solid models.

Learn more >

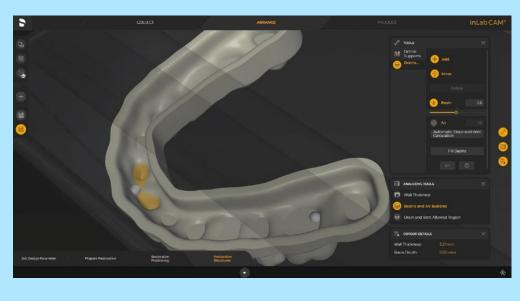

#### Analysis tools

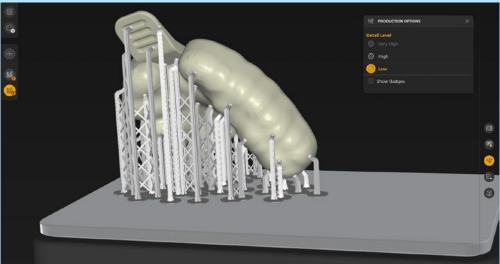

For quality enhancement, the software indicates compliance or noncompliance with manufacturer-specified wall strength – a special advantage of the validation process that was performed for each Primeprint material. As such, additional corrections can be made, for example in the case file when cases of noncompliance are detected.

A color-coded system interactively visualizes the support quality.

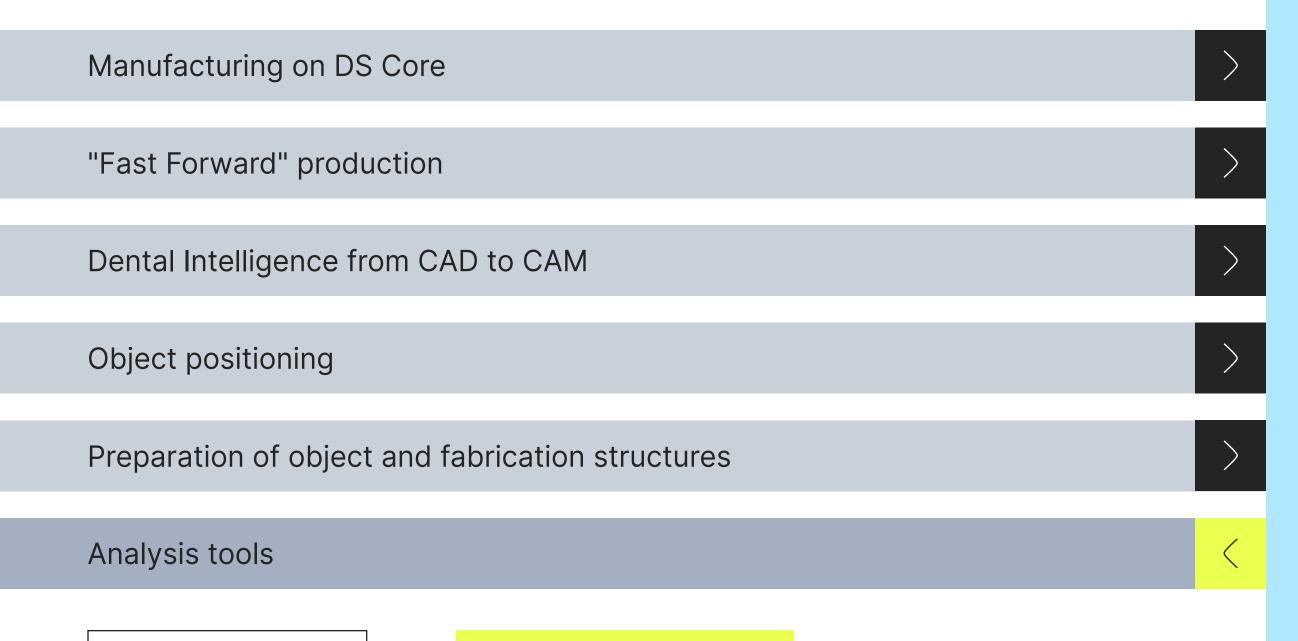

The software indicates where air may potentially get trapped during the wash process later on or where puddling of resin may occur, which might not be cleaned up. In this case, drainage canals can be positioned virtually, based on the planned print placement, directly in the CAM software without the need to go back to the design phase.

Depending on the application and its desired surface quality, different thicknesses can be defined with the appropriate detail level, thereby optimizing print times.

As such, additional corrections can be made, for example in the case file when cases of noncompliance are detected.

A color-coded system interactively visualizes the support quality.

A quality process protocol documents the manufacturing process for each medical device produced with Primeprint Solution. In addition to the simplified distributor declaration of MDR conformity, it can be used as proof of compliance with the process specifications validated by the material manufacturer.

## Primeprint – 3D Printer

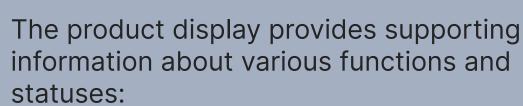

Before starting the manufacturing step, the Primeprint Material Unit (or the Primeprint Material Unit Type S) and Primeprint Box together with the building platform are inserted into the 3D printer, then the print process can begin immediately. After completing the print, the 3D printer can immediately be prepared for the next print job. Simply change Primeprint Box and Material Unit.

Learn more >

- Availability of Primeprint Box, material unit and job data
- System settings and routine actions
- Start preheating
- Resin amount per job, remaining resin and color coding

Primeprint Solution has been a very important part of our practice. We deliver a large number of splints and occlusal guards each month, so being able to manufacture them in-house created a solution with a high level of cost-efficiency for our patients. I can trust the post-processing unit to deliver clean and safe medical devices for my patients, without any risk of cross-contamination with other types of resins.

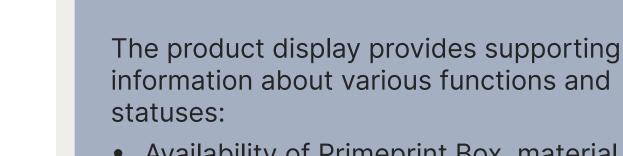

## Primeprint – 3D Printer

Before starting the manufacturing step, the Primeprint Material Unit (or the Primeprint Material Unit Type S) and Primeprint Box together with the building platform are inserted into the 3D printer, then the print process can begin immediately. After completing the print, the 3D printer can immediately be prepared for the next print job. Simply change Primeprint Box and Material Unit.

Learn more >

- Availability of Primeprint Box, material unit and job data
- System settings and routine actions
- Start preheating
- Resin amount per job, remaining resin and color coding

The Primeprint Material Unit and Material Unit Type S consist of the vat and the insertion slot for the material cartridge. Material Unit Type S enables transparent printing results and is used for printing of Primeprint Splint SF and Primeprint Splint ST. The cartridge clicks into both types of Material Units with a hand movement. Both the vat and the material cartridge are fitted with RFID tags. Once assembled, the software automatically pairs them and indentifies them as a unit.

### Primeprint – 3D Printer

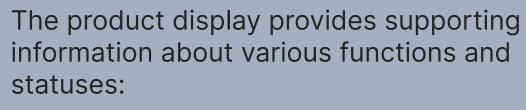

Before starting the manufacturing step, the Primeprint Material Unit (or the Primeprint Material Unit Type S) and Primeprint Box together with the building platform are inserted into the 3D printer, then the print process can begin immediately. After completing the print, the 3D printer can immediately be prepared for the next print job. Simply change Primeprint Box and Material Unit.

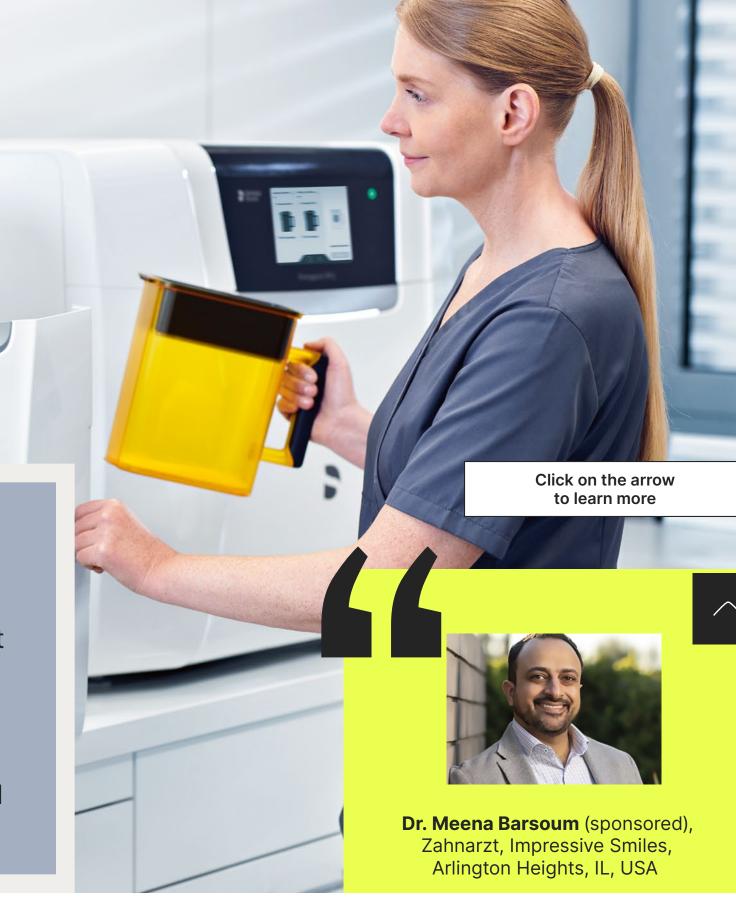

Learn more >

- Availability of Primeprint Box, material unit and job data
- System settings and routine actions
- Start preheating
- Resin amount per job, remaining resin and color coding

The Primeprint Material Unit and Material Unit Type S are protected from UV light. This means that the remaining resin can stay in the vat until the next use. The closed cartridge prevents skin and device from being exposed to the liquid resin.

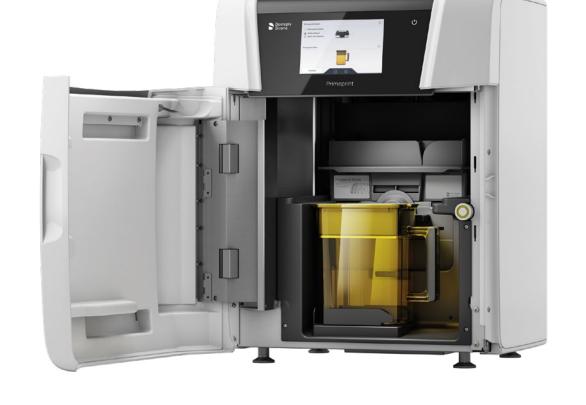

### Primeprint – 3D Printer

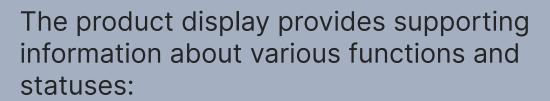

Before starting the manufacturing step, the Primeprint Material Unit (or the Primeprint Material Unit Type S) and Primeprint Box together with the building platform are inserted into the 3D printer, then the print process can begin immediately. After completing the print, the 3D printer can immediately be prepared for the next print job. Simply change Primeprint Box and Material Unit.

### Primeprint PPU – Post-Processing Unit

The PPU performs all post-processing steps required for the dental 3D print automatically and without manual interaction – with the option to delegate.

- Pre-washing: First wash cycle
- Final washing: Second wash cycle
- Drying
- Light-curing

Thus, any time-consuming manual postprocessing is eliminated. All PPU process steps are protected from UV light and are controlled and monitored by the CAM software. A protocol can be created as PDF.

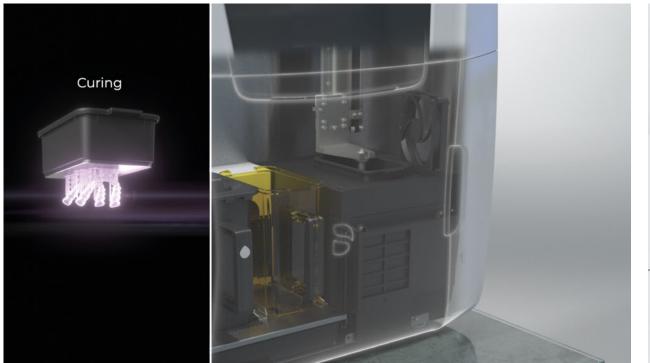

After the print is completed, only the Primeprint Box is removed from the printer and placed into the PPU. The Primeprint Box is sealed and protected from UV light; it does not require any additional contact precautions. Based on the RFID identifier, the individual job is detected and the fully automated post-processing begins with just one click on the screen. The rest is taken care of by the PPU.

All processes are individually developed for each material and are validated by the respective material manufacturer.

### Primeprint PPU -Post-Processing Unit

The PPU performs all post-processing steps required for the dental 3D print automatically and without manual interaction – with the option to delegate.

Pre-washing: First wash cycle

Final washing: Second wash cycle

Drying

Light-curing

Thus, any time-consuming manual postprocessing is eliminated. All PPU process step: X

are c

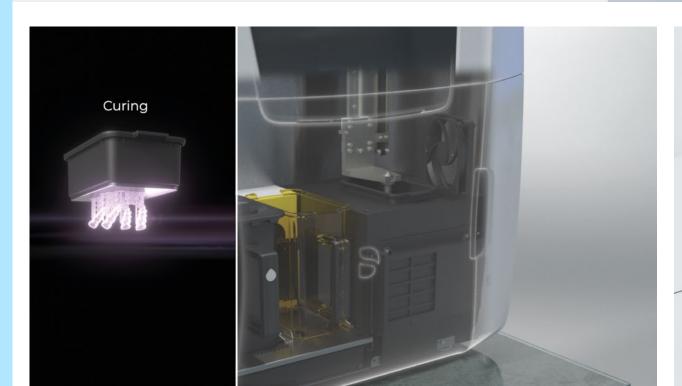

Consecutive pre- and final washing cycles use cleaning agent in the two integrated washing containers to remove liquid print resin residues from the printed objects. The Primeprint Washing Container concept allows each container to be filled with up to 2.5 I of isopropanol, thus enabling the individual storage of several containers.

The washing containers can easily be removed and reinserted and feature automatic fill level monitoring and leak protection. The assignment to pre- and final wash is done automatically. The software tracks the wash cycles of each container via their RFID tags, monitors the corresponding cleaning agent lifetime per washing container, and automatically alerts the user when cleaning agent must be exchanged.

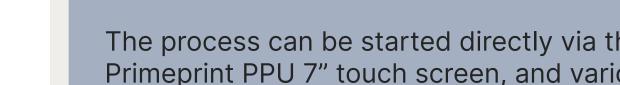

### Primeprint PPU – Post-Processing Unit

The PPU performs all post-processing steps required for the dental 3D print automatically and without manual interaction – with the option to delegate.

- Pre-washing: First wash cycle

The completed printed objects are attached to the building platform with the support structures and can be removed quickly and easily with just a few moves.

The Primeprint Solution Platform Holder is specially designed to make removal even easier. It anchors the building platform in a non-slip manner and catches detached print parts.

### Primeprint Solution – Material concept

Validated materials and RFID-supported, automated material management support quality, process, and documentation security. All material parameters were optimized to offer a high level of process safety for each application.

Intro

The Primeprint material concept offers user-friendly support with its color-coded material cartridge system. Each print material type is associated with a different color, which is mirrored in the CAM software for quick orientation, for correct material selection, and easily identifiable storage.

Dr. Verena Freier (sponsored), Dentist, Zahnmedizin Bad Soden, Germany

As a newcomer in dental 3D printing, I am not only interested in a broad range of indications, but also in easy handling and smooth integration into our practice processes. And this has been achieved particularly well with Primeprint Solution. In my opinion, the software is very user-friendly and can be integrated very well into my digital workflow. The printer and post-processing unit offer a high level of user-friendliness and clean 3D printing thanks to no contact with printing resins.All this means enormous time savings and safety for us in our day-to-day practice. And I can delegate the 3D printing tasks to my practice team with a good feeling.

### Primeprint Solution -In the practice

Primeprint Solution enables dentists to improve patient experience and offer additional procedures, thereby expanding their practice. It integrates easily into existing digital workflows and seamlessly into the entire DS Digital Universe for excellence in dental practices.

#### The Primeprint Solution workflow in the practice:

#### 1 Intraoral scanning

Primescan enables high precision digital impressions with a patented scanning technology. Impression taking with Primescan is easy and intuitive. If the patient is scanned with Primescan 2, the intraoral scan is captured in DS Core, immediately freeing up the scanner for the next patient.1

#### 4 3D printing and post-processing

Primeprint Solution reduces handling times and manual work, allows for full delegation, and maximizes productivity. The use of regulated parameters help to ensure high quality of printed appliances for excellent treatment outcomes. The Primeprint Box enables convenient and easy material handling without direct contact with resins.

Primeprint printer and Primeprint PPU are two closed desktop units, which easily integrate into the dental practice. A particular advantage is that no fume hood is required.

1 A paid DS Core subscription is mandatory.

2 A standard or advanced DS Core subscription is mandatory.

#### 2 Application design

The design can either be created with the CEREC or inLab CAD software. If the design is not intended to be made in-house, the dentist can use DS Core Create Design Service to get access to high-quality custom designs created by expert lab technicians. The designs can easily be requested via DS Core without having to operate a

#### 5 Finalization

The platform holder offers convenient support for the fast removal of printed objects from the building platform, before the support structures are removed and the applications can be prepared for further employment

#### 3 Preparation of print job

After automatic job preparation in the CAM software, the 3D printing process can begin immediately.

With Manufacturing on DS Core the print job can be started directly from DS Core.1

# Primeprint Solution – In the dental lab

Primeprint Solution expands the digital manufacturing options in the dental lab and can be integrated easily into existing digital workflow.

Learn more >

Click on the arrow to learn more

#### $\overline{\phantom{a}}$

#### The Primeprint Solution workflow in the dental lab:

#### 1 Digital design

In the dental laboratory, the restoration design is created based on intraoral or extraoral scan data and carried out using the dental laboratory's CAD software, e.g. inLab Software, or software from another manufacturer<sup>1</sup>. inLab CAD Software automatically takes into account the design parameters for 3D printing with Primeprint.

#### 2 Preparation of print job

Object and order data from the inLab CAD software are automatically applied from the inLab CAM Software, which eliminates the need to enter them again. Design data of other CAD software are imported into the open inLab CAM Software in STL format<sup>1</sup> and prepared for the print process with just a few clicks.

#### 3 3D printing and post-processing

3D printing and post-processing with Primeprint Solution are easily and comfortably performed in the dental lab through a highly automated process.

#### 4 Finalization

The Primeprint Solution Platform Holder supports quick removal of the printed objects from the building platform before support structures can be removed, and the application can be prepared for further processing.
