Purevac® SC
Evacuation System Cleaner Dispenser

Practice Protect

Instructions For Use

It's even easier to dispense Purevac SC Evacuation System Cleaner with the Purevac SC Evacuation System Cleaner Dispenser. It creates a turbulent mixture of air and Purevac SC solution to clean out your evacuation line system in dental practices with or without an amalgam separator. A convenient handle allows you to transport it to multiple operatories.

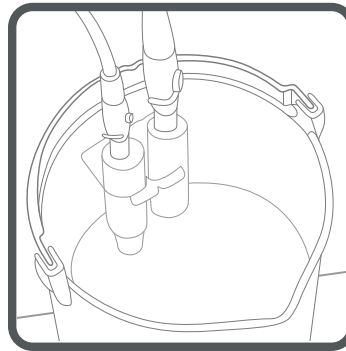

1. Fill the Purevac SC Evacuation System Cleaner Dispenser with room temperature tap water up to the appropriate fill marker on the inside of the unit. Use one (1) quart or one (1) liter per operatory, plus one (1) quart or one (1) liter for cuspidors.

   NOTE: FIRST TIME USERS SHOULD ADD 2 OZ (60 mL) OF PUREVAC SC TO ONE QUART (1 LITER) OF WATER.

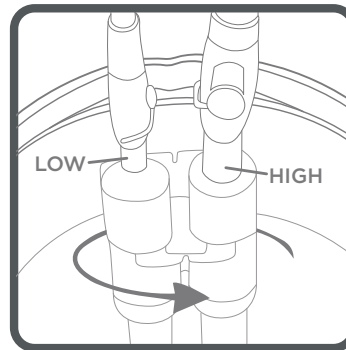

2. Add Purevac SC Evacuation System Cleaner. Pump 1 oz (30 mL) of Purevac SC solution per quart or liter of water into the dispenser. 1 oz (30 mL) = 1 pump.

3. For suction lines with US fittings, attach the enclosed adaptors onto the plastic fittings on the dispenser. These adaptors are not required for metric-sized fittings.

LOW — HIGH

4. Place the high volume evacuation and saliva ejectors onto the plastic fittings.

5. Turn the suction lines on. Aspirate solution until the next fill marker is visible on the dispenser. Turn off the vacuum lines, remove them from the dispenser fittings and return them to the hangers. Turn the suction back on to both lines. Keep suction on in first operatory and repeat steps 3 and 4 for each remaining operatory.

6. Turn off the suction in the first operatory.

7. Pour any remaining solution to clean cuspidors. Repeat the process for additional operatories.
